Mathematics Mastery

Progression in calculations Year 1 – Year 6* September 2017

NB. Users should familiarise themselves with the introduction (pp 2-10) to this document before referring to individual year group guidance.

*Progression guidance is not provided for EYFS/Reception since the focus should be on the understanding of early number concepts and number sense through the use of concrete manipulatives, as exemplified in the programmes of study.

Introduction

At the centre of the mastery approach to the teaching of mathematics is the belief that all pupils have the potential to succeed. They should have access to the same curriculum content and, rather than being extended with new learning, they should deepen their conceptual understanding by tackling challenging and varied problems. Similarly, with calculation strategies, pupils must not simply rote learn procedures but demonstrate their understanding of these procedures through the use of concrete materials and pictorial representations. This document outlines the different calculation strategies that should be taught and used in Years 1 to 6, in line with the requirements of the 2014 Primary National Curriculum.

Background

The 2014 Primary National Curriculum for mathematics differs from its predecessor in many ways. Alongside the end of Key Stage year expectations, there are suggested goals for each year; there is also an emphasis on depth before breadth and a greater expectation of what pupils should achieve.

One of the key differences is the level of detail included, indicating what pupils should be learning and when. This is suggested content for each year group, but schools have been given autonomy to introduce content earlier or later, with the expectation that by the end of each key stage the required content has been covered.

For example, in Year 2, it is suggested that pupils should be able to 'add and subtract one-digit and two-digit numbers to 20, including zero' and a few years later, in Year 5, they should be able to 'add and subtract whole numbers with more than four digits, including using formal written methods (columnar addition and subtraction)'.

In many ways, these specific objectives make it easier for teachers to plan a coherent approach to the development of pupils' calculation skills, and the expectation of using formal methods is rightly coupled with the explicit requirement for pupils to use multiple representations, including concrete manipulatives and images or diagrams – a key component of the mastery approach.

Purpose

The purpose of this document is threefold. Firstly, in this introduction, it outlines the structures for calculations, which enable teachers to systematically plan problem contexts for calculations to ensure pupils are exposed to both standard and non-standard problems. Secondly, it makes teachers aware of the strategies that pupils are formally taught within each year group, which will support them to perform mental and written calculations. Finally, it supports teachers in identifying appropriate pictorial representations and concrete materials to help develop understanding.

The policy only details the strategies; teachers must plan opportunities for pupils to apply these, for example, when solving problems, or where opportunities emerge elsewhere in the curriculum.

How to use the document

For each of the four rules of number, different strategies are laid out, together with examples of what concrete materials can be used and how, along with suggested pictorial representations. Please note that the concrete and pictorial representation examples are not exhaustive, and teachers and pupils may well come up with alternatives. The purpose of using multiple representations is to give pupils a deep understanding of a mathematical concept and they should be able to work with and explain concrete, pictorial and abstract representations, and explain the links between different representations. Depth of understanding is achieved by moving between these representations. For example, if a child has started to use a pictorial representation, it does not mean that the concrete

cannot be used alongside the pictorial. If a child is working in the abstract, depth can be evidenced by asking them to exemplify their abstract working using a concrete or pictorial representation and to explain what they have done using the correct mathematical vocabulary; language is, of course, one abstract representation but is given particular significance in the national curriculum.

Mathematical language

The 2014 National Curriculum is explicit in articulating the importance of pupils using the correct mathematical language as a central part of their learning. Indeed, in certain year groups, the non-statutory guidance highlights the requirement for pupils to extend their language around certain concepts.

pupils' responses to include it *in full sentences*.

Suggested language structures accompany each strategy outlined in this document. These build on one another systematically, which supports pupils in making links between

and across strategies as they progress through primary school. <u>zero</u> <u>oh (the letter O)</u> New vocabulary should be introduced in a suitable context (for example, with relevant real objects, manipulatives, pictures or diagrams) and explained precisely. High expectations of the mathematical language used are essential, with teachers modelling accurate mathematical vocabulary and expecting

Presentation of calculations

You will see that throughout this document, calculations are presented in a variety of ways. It is important for pupils' mathematical understanding to experience and work with calculations and missing numbers in different positions relative to the = symbol. Examples used in classwork and independent work should reflect this.

Estimation

Pupils are expected to use their developing number sense from Year 1 to make predictions about the answers to their calculations. As their range of mental strategies increases, these predictions and, later, estimates should become increasingly sophisticated and accurate. All teaching of calculation should emphasise the importance of making and using these estimates to check, first, the sense and, later, the accuracy of their calculations.

Developing number sense

Fluency in arithmetic is underpinned by a good sense of number and an ability to understand numbers as both a concept (e.g. 7 is the value assigned to a set of seven objects) and as something resulting from a process (three beads and four more beads gives seven beads altogether or 3 + 4 = 7). Understanding that a number can be partitioned in many ways (e.g. 7 = 4 + 3; 5 + 2 = 7; 1 + 6 = 7) is key to being able to use numbers flexibly in calculating strategies. The part-whole model and, later, bar models, are particularly useful for developing a relational understanding of number. Pupils who are fluent in number bonds (initially within ten and then within twenty) will be able to use the 'Make ten' strategy efficiently, enabling them to move away from laborious and unreliable counting strategies, such as 'counting all' and 'counting on'. Increasing fluency in efficient strategies will allow pupils to develop flexible and interlinked approaches to addition and subtraction. At a later stage, applying multiplication and division facts, rather than relying on skip-counting, will continue to develop flexibility with number.

zero	oh (the letter O)

Structures and contexts for calculations

There are multiple contexts (the word problem or real-life situation, within which a calculation is required) for each mathematical operation (i.e. addition) and, as well as becoming fluent with efficient calculating strategies, pupils also need to become fluent in identifying which operations are required. If they are not regularly exposed to a range of different contexts, pupils will find it difficult to "In a technological age, in which most calculations are done on machines, it surely cannot be disputed that knowing which calculation to do is more important than being able to do the calculation."

Derek Haylock (2014); Mathematics Explained for Primary Teachers, p.56

apply their understanding of the four operations. For each operation, a range of contexts can be identified as belonging to one of the conceptual 'structures' defined below.

The **structure** is distinct from both the **operation** required in a given problem and the **strategy** that may be used to solve the calculation. In order to develop good number sense and flexibility when calculating, children need to understand that many strategies (preferably the most efficient one <u>for them</u>!) can be used to solve a calculation, once the correct operation has been identified. There is often an implied link between the given structure of a problem context and a specific calculating strategy. Consider the following question: A chocolate bar company is giving out free samples of their chocolate on the street. They began the day with 256 bars and have given away 197. How many do they have remaining? The reduction context implicitly suggests the action of 'taking away' and might lead to a pupil, for example, counting back or using a formal algorithm to subtract 197 from 256 (seeing the question as 256 - 197 =]. However, it is much easier to find the difference between 197 and 256 by adding on (seeing the question as 197 +] = 256). Pupils with well-developed number sense and a clear understanding of the inverse relationship between addition and subtraction will be confident in manipulating numbers in this way.

Every effort is made to include multiple contexts for calculation in the Mathematics Mastery materials but, when teachers adapt the materials (which is absolutely encouraged), having an awareness of the different structures and being sure to include a range of appropriate contexts, will ensure that pupils continue to develop their understanding of each operation. The following list should not be considered to be exhaustive but defines the structures (and some suggested contexts) that are specifically included in the statutory objectives and the non-statutory guidance of the national curriculum. Specific structures and contexts are introduced in the Mathematics Mastery materials at the appropriate time, according to this guidance.

Importance of knowns vs unknowns and using part-whole understanding

One of the key strategies that pupils should use to identify the correct operation(s) to solve a given problem (in day-to-day life and in word problems) is to clarify the known and unknown quantities and identify the relationships between them. Owing to the inverse relationship between addition and subtraction, it is better to consider them together as 'additive reasoning', since changing which information is unknown can lead to either addition or subtraction being more suitable to calculate a solution for the same context. For the same reason, multiplication and division are referred to as 'multiplicative reasoning'. Traditionally, approaches involving key vocabulary have been the main strategy used to identify suitable operations but owing to the shared underlying structures, key words alone can be ambiguous and lead to misinterpretation (see for example the question below about Samir and Lena, where the key word 'less' might be identified, but addition is required to solve the problem).

A more effective strategy is to encourage pupils to establish what they know about the relationship between the known and unknown values and if they represent a part or the whole in the problem, supported through the use of part-whole models and/or bar models. In the structures exemplified

below, the knowns and unknowns have been highlighted. Where appropriate, the part-whole relationships have also been identified. Pupils should always be given opportunities to identify and discuss these, both when calculating and when problem-solving.

Standard and non-standard contexts

Using key vocabulary as a means of interpreting problems is only useful in what are in this document defined as 'standard' contexts, i.e. those where the language is aligned with the operation used to solve the problem. Take the following example:

First there were 12 people on the bus. <u>Then</u> three **more** people got on. How many people are on the bus <u>now</u>?

Pupils would typically identify the word 'more' and assume from this that they need to add the values together, which in this case would be the correct action. However, in non-standard contexts, identifying key vocabulary is unhelpful in identifying a suitable operation. Consider this question:

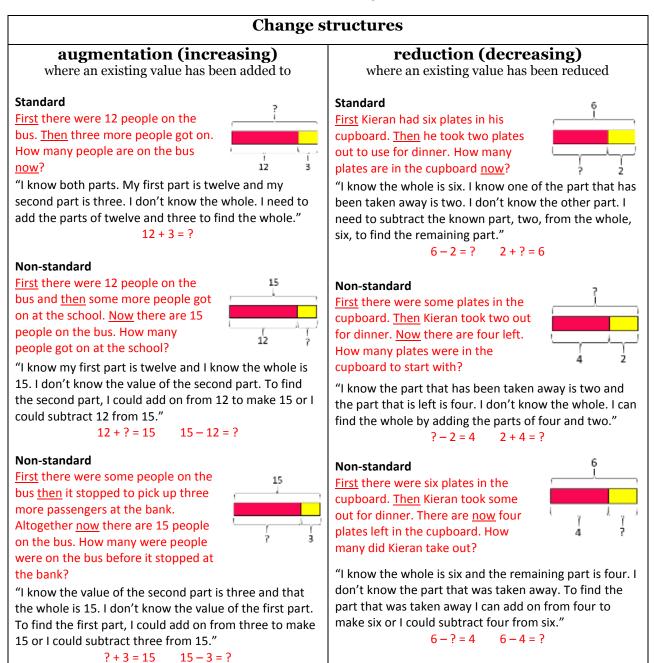

First there were 12 people on the bus and <u>then</u> some more people got on at the school. <u>Now</u> there are 15 people on the bus. How many people got on at the school?

Again the word 'more' would be identified, and a pupil may then erroneously add together 12 and 15. It is therefore much more helpful to consider known and unknown values and the relations between them.

Overexposure to standard contexts and lack of exposure to non-standard contexts will mean pupils are more likely to rely on 'key vocabulary' strategies, as they see that this works in most of the cases they encounter. It is therefore important, when adapting lesson materials, that non-standards contexts are used systematically, alongside standard contexts.

Additive reasoning

Note: the 'first... then... now' structure is used heavily in KS1 to scaffold pupils' understanding of change structures. Once pupils are confident with the structures, such linguistic scaffolding can be removed, and question construction can be changed to expose pupils to a greater range of nuance in interpreting problems. For example, the second and third reduction problems could be reworded as follows:

Kieran took two plates out of his cupboard for dinner. There were four left. How many plates were in the cupboard to begin with?

There were six plates in the cupboard before Kieran took some out for dinner. If there were four plates left in the cupboard, how many did Kieran take out?

Copyright © 2017 Mathematics Mastery. This can be printed out and photocopied by Mathematics Mastery toolkit registered users only. For further information, please see our terms and conditions at <u>www.mathematicsmastery.org/terms-and-conditions</u>

These present the same knowns and unknowns, and therefore the same bar models and resulting equations to solve the problems; however, the change in wording makes them more challenging to pupils who have only worked with a 'first... then... now' structure so far.

Part-whole structures			
Combination (aggregation)/partitioning combining two or more discrete quantities/splitting one quantity into two or more sub-quantities			
Hakan and Sally have made a stack of their favourite books. Four books belong to Hakan, three to Sally. How many books are in the stack altogether? "I know both parts. One part is four and the other part is three. I don't know the whole. I need to add the parts of three and four to find the whole." 4+3=? $3+4=?$? 		
(Only one problem has been written for combination as, owing to the commutativity of addition, the only change in question wording would be to swap Hakan and Sally's names. The resulting bar model and calculation would be identical.)			
Sally and Hakan have made a stack of their favourite books. There are seven books altogether. If three of them are Sally's, how many belong to Hakan? "I know the whole is seven and that one of the parts is three. I don't know the other part. I need to add on from three to make seven or subtract three from seven to find the other part." 3 + ? = 7 $7 - 3 = ?$	7 		
Sally and Hakan have made a stack of their favourite books. There are seven books altogether. If four of them are Hakan's, how many belong to Sally?	7		
"I know the whole is seven and that one of the parts is four. I don't know the other part. I need to add on from four to make seven or subtract four from seven to find the other part." 4 + ? = 7 $7 - 4 = ?$	4 ?		

Note: all part-whole contexts are considered to be 'standard', as the language of part-whole is unambiguous.

Comparison structures

Comparison structures involve a relationship between two quantities; their relationship is expressed as a difference. The structures vary by which of the values are known/unknown (the larger quantity, the smaller quantity and/or their difference). Part-whole language is not used here because the context contains not one single 'whole', but instead two separate quantities and it is the relationship between them being considered. Comparison bar models are therefore used to model these structures, which are known to be the most challenging for pupils to interpret.

Smaller quantity and larger quantity are known (comparative difference)

Standard

Navin has saved £19 from his pocket money. Sara has saved £31 from her pocket money. How much **more** has Sara saved than Navin? **or** How much **less** has Navin saved than Sara?

Smaller quantity and difference are known (comparative addition)

Standard

Ella has six marbles. Robin has three more than Ella. How many marbles does Robin have?

"I know the smaller quantity is six. I know the difference is three. I don't know the larger quantity. To find the larger quantity I need to add three to six." 6+3=?

Non-standard

Samir and Lena are baking shortbread but Lena's recipe uses 15g **less** butter than Samir's. If Lena needs to use 25g of butter, how much does Samir need?

"I know the smaller quantity is 25. I know the difference between the quantities is 15. I don't know the larger quantity. To find the larger quantity I need to add 15 to 25." ? - 15 = 25 25 + 15 = ?

Larger quantity and difference are known (comparative subtraction)

Non-standard

Ella has some marbles. Robin has three **more** than Ella and he has nine marbles in total. How many marbles does Ella have?

"I know the larger quantity is nine. I know the difference between the quantities is three. I don't know the smaller quantity. To find the smaller quantity I need to add on from three to make nine or subtract three from nine."

?+3=9 9-3=?

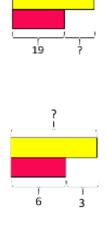

Standard

Samir's shortbread recipe uses 40g of butter. Lena's recipe uses 15g **less** butter. How much butter does Lena need?

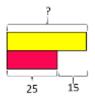

"I know one quantity is 40. I know the difference between the quantities is 15. I don't know the smaller quantity but I know it is 15 less than 40. To find the smaller quantity, I need to subtract 15 from 40."

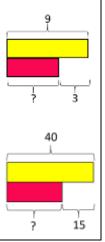

40 - 15 = ? ? + 15 = 40

Multiplicative reasoning

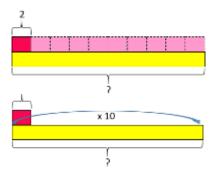

Scaling structures

scaling up

('times greater/times as much') the original value is increased by a given scale factor

Rita receives £2 pocket money every week. Sim earns ten times as much money for her paper round. How much money does Sim earn?

"I know one value is two and I know the second value is ten times greater. I don't know the second value. To find the second value, I need to multiply two by ten."

2 × 10 = ?

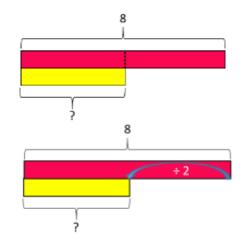

scaling up ('times as many') the value of the original quantity is increased by a

given scale factor

scaling down ('times smaller/times less')

the original value is reduced by a given scale factor

The house in my model village needs to be half the height of the church. If the church is 8 cm tall, how tall does the house need to be?

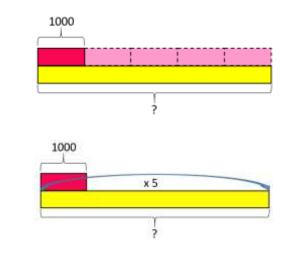

"I know one value is eight and I know the second value is half as great. I don't know the second value. To find the second value, I need to halve eight (or divide it by two)." Half of 8 is ? $8 \div 2 = ?$

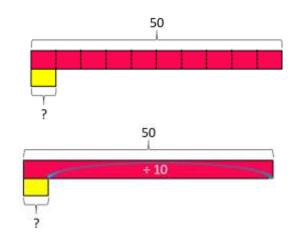

scaling down ('times fewer')

the value of the original quantity is decreased by a given scale factor

The Albert Hall can hold five times as many people as the Festival Hall. If the Festival Hall holds 1000 people, how many does the Albert Hall hold?

"I know one value is 1000 and I know the second value is five times greater. I don't know the second value. To find the second value, I need to multiply 1000 by five." $1000 \times 5 = ?$ Anouska's garden pond has ten times fewer frogs than fish. If there are fifty fish, how many frogs are there?

"I know one value is 50 and I know the second value is ten times less. I don't know the second value. To find the second value, I need to divide fifty by ten." $50 \div 10 = ?$

Progression in calculations Year 1

National curriculum objectives linked to addition and subtraction

These objectives are explicitly covered through the strategies outlined in this document:

- Add and subtract one-digit and two-digit numbers to 100, including zero (N.B. Year 1 N.C. objective is to do this with numbers to 20).
- Add and subtract numbers using concrete objects, pictorial representations, and mentally, including: a two-digit number and ones, a two-digit number and tens, 2 two-digit numbers; add 3 one-digit numbers (Year 2).
- Represent and use number bonds and related subtraction facts within 20.
- Given a number, identify 1 more and 1 less.
- Show that addition of two numbers can be done in any order (commutative) but subtraction of one number from another cannot (Year 2).
- Recognise the inverse relationship between addition and subtraction and use this to solve missing number problems (Year 2).

The following objectives should be planned for lessons where new strategies are being introduced and developed:

- Read, write and interpret mathematical statements involving addition (+), subtraction (-) and equal (=) signs.
- Solve one-step problems that involve addition and subtraction, using concrete objects and pictorial representations, and missing number problems, such as 7 = □ 9.
- Solve problems with addition and subtraction:
 - Using concrete objects and pictorial representations, including those involving numbers, quantities and measures
 - Applying their increasing knowledge of mental methods

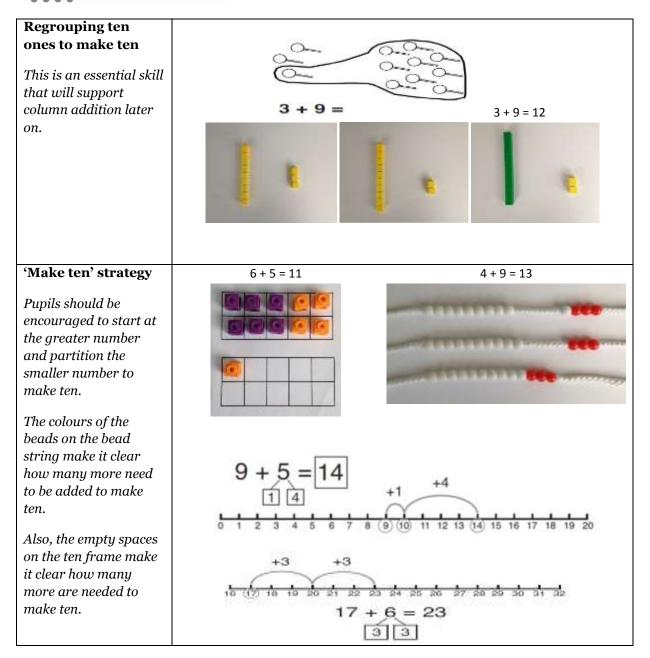

Teachers should refer to the definitions and guidance on the <u>structures for addition and</u> <u>subtraction</u> to provide a range of appropriate real-life contexts for calculations.

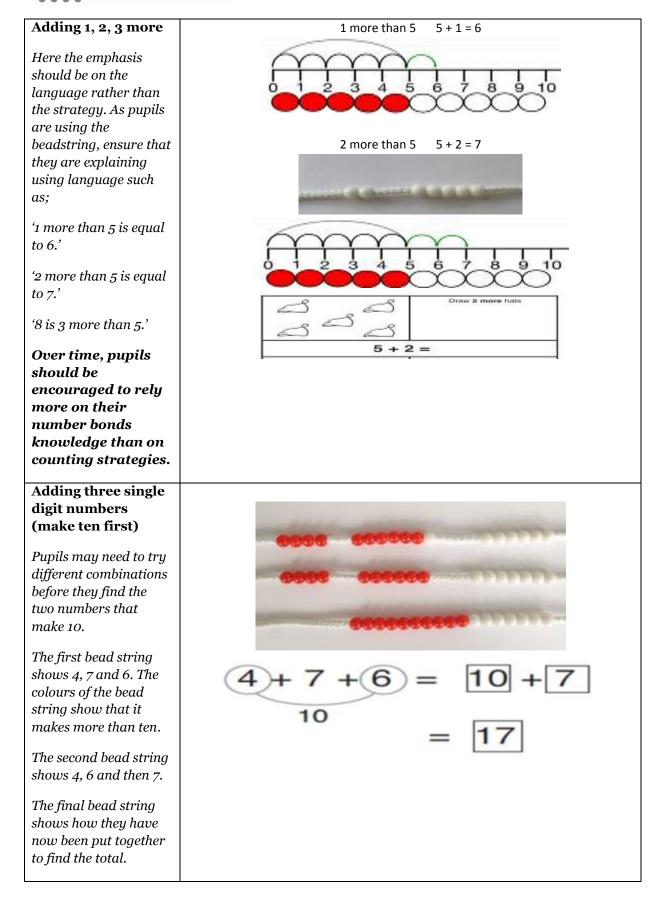

Y1 Addition

Strategy & guidance	СРА
Count all Joining two groups and then recounting all objects using one-to- one correspondence	3+4=7 3+4=7 3+4=7 1 2 3 4 5 6 7 8 9 10 5+3=8
Counting on As a strategy, this should be limited to adding small quantities only (1, 2 or 3) with pupils understanding that counting on from the greater number is more efficient.	8+1=9 15=12+3 15=12
Part-part-whole Teach both addition and subtraction alongside each other, as pupils will use this model to identify the inverse relationship between them. This model begins to develop the understanding of the commutativity of addition, as pupils become aware that the parts will make the whole in any order.	10

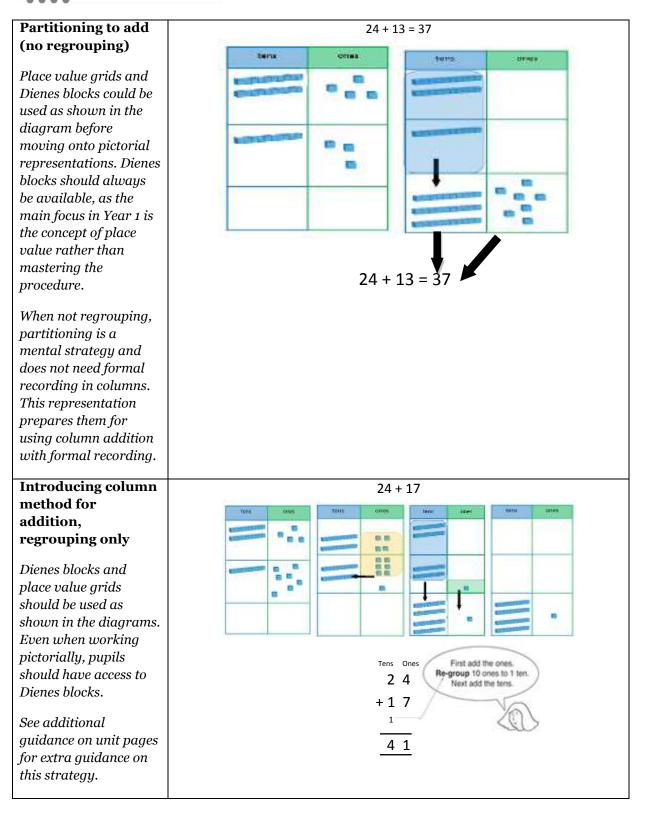

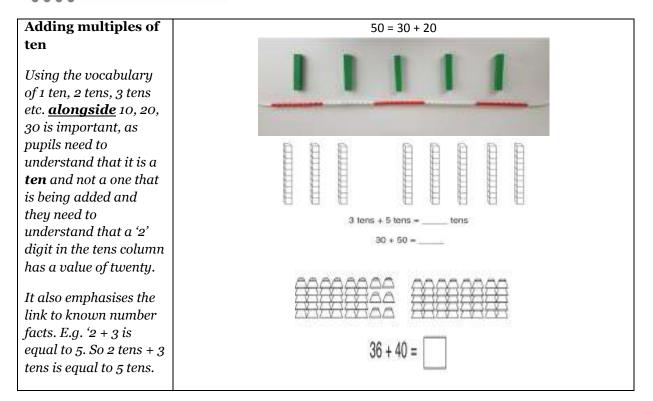

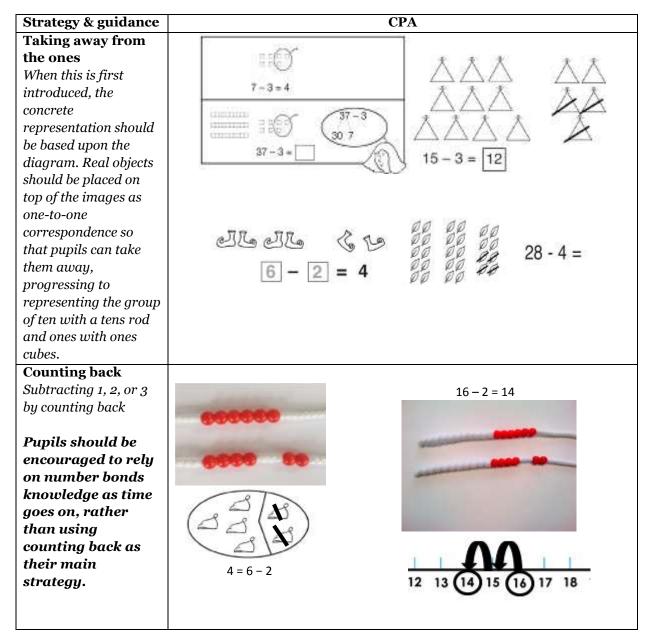

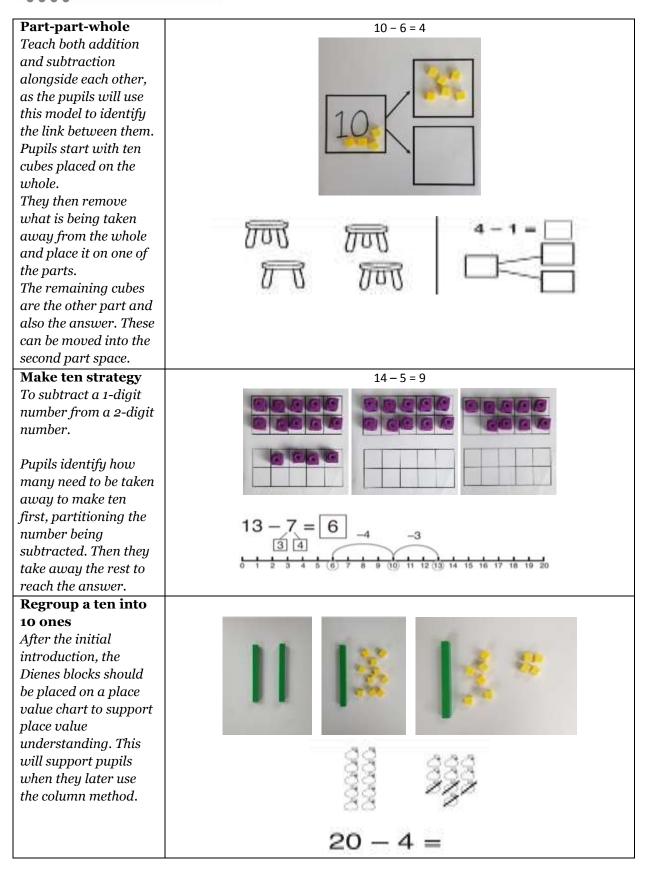

Y1 Subtraction

Taking away from	9 = 15-6	
the tens		
Pupils should identify that they can also take away from the tens and get the same answer. This reinforces their knowledge of number bonds to 10 and develops their		
application of number bonds for mental strategies.		
Partitioning to	34 - 13 = 21	
subtract without regrouping		
Dienes blocks on a place value chart (developing into using images on the chart)		
could be used, as when adding 2-digit numbers, reinforcing the main concept of place value for Year 1.		
IATh on mot no anounin a	34 - 13 = 21	
When not regrouping, partitioning is a		
mental strategy and		
does not need formal		
recording in columns.		
This representation prepares them for		
using column		
subtraction with formal recording.		

Subtracting	40 = 60 - 20	38 - 10 = 28
multiples of ten Using the vocabulary of 1 ten, 2 tens, 3 tens etc. alongside 10, 20, 30 is important as pupils need to understand that it is a ten not a one that is being taken away.		**
	6 bans - 2 bans = tens	38 - 10 =
Column method with regrouping This example shows how pupils should work practically when being introduced to this method. There is no formal recording in columns in Year 1 but this practical work will prepare pupils for formal methods in Year 2. See additional guidance on unit pages to support with this method.		= 17

National Curriculum objectives linked to multiplication and division

These objectives are explicitly covered through the strategies outlined in this document:

• Solve one-step problems involving multiplication and division, by calculating the answer using concrete objects, pictorial representations and arrays with the support of the teacher.

Teachers should refer to definitions and guidance on the <u>structures for multiplication</u> and <u>division</u> to provide a range of appropriate real-life contexts for calculations.

Strategy & guidance	СРА
Skip counting in multiples of 2, 5, 10 from zero The representation for the amount of groups supports pupils' understanding of the	
written equation. So two groups of 2 are 2, 4. Or five groups of 2 are 2, 4, 6, 8, 10.	4 × 5 = 20
<i>Count the groups as pupils are skip counting.</i>	
Number lines can be used in the same way as the bead string.	
Pupils can use their fingers as they are skip counting.	2 × 4 = 8
Making equal groups	
and counting the total How this would be represented as an equation will vary. This could be 2×4 or 4×2 . The importance should be placed on the vocabulary used alongside the equation. So this picture could represent 2 groups of 4 or 4 twice.	$Draw \bigcirc 1 \text{ to show } 2 \times 3 = 6$

Y1 Multiplication

Solve multiplications $3 \times 3 = 3 + 3 + 3$ using repeated addition This strategy helps pupils make a clear link between multiplication and division as well as exemplifying the 'repeated addition' structure for multiplication. It is a natural progression from the previous 'count all' strategy as pupils can be encouraged to 'count on'. *However, as number bonds* knowledge grows, pupils should rely more on these *important facts to calculate* How many apples are there altogether? efficiently. 3 + 3 + 3 = 9

Y1 Division

Strategy & guidance	CPA 10 ÷ 2 = 5	
Sharing objects into groups		
Pupils should become familiar with division equations through working practically. The division symbol is not formally taught at this		
stage.	There are 10 sweets. Bing groups of 2.	
	2012012012012012012012012012012012012012	
	There are groups of 2.	
	Draw an equal number of apples for each basket.	

Progression in calculations Year 2

National Curriculum objectives linked to addition and subtraction

These objectives are explicitly covered through the strategies outlined in this document:

- Add and subtract numbers using concrete objects, pictorial representations, and mentally, including: a two-digit number and ones; a two-digit number and tens; 2 two-digit numbers; adding three one-digit numbers.
- Add and subtract numbers mentally, including: a three-digit number and ones; a three-digit number and tens; a three-digit number and hundreds (Year 3).
- Recall and use addition and subtraction facts to 20 fluently, and derive and use related facts up to 100.
- Find 10 or 100 more or less than a given number (Year 3).
- Show that addition of two numbers can be done in any order (commutative) but subtraction of one number from another cannot.
- Recognise and use the inverse relationship between addition and subtraction and use this to check calculations and solve missing number problems.
- Add and subtract numbers with up to three digits, using formal written methods of columnar addition and subtraction (Year 3).

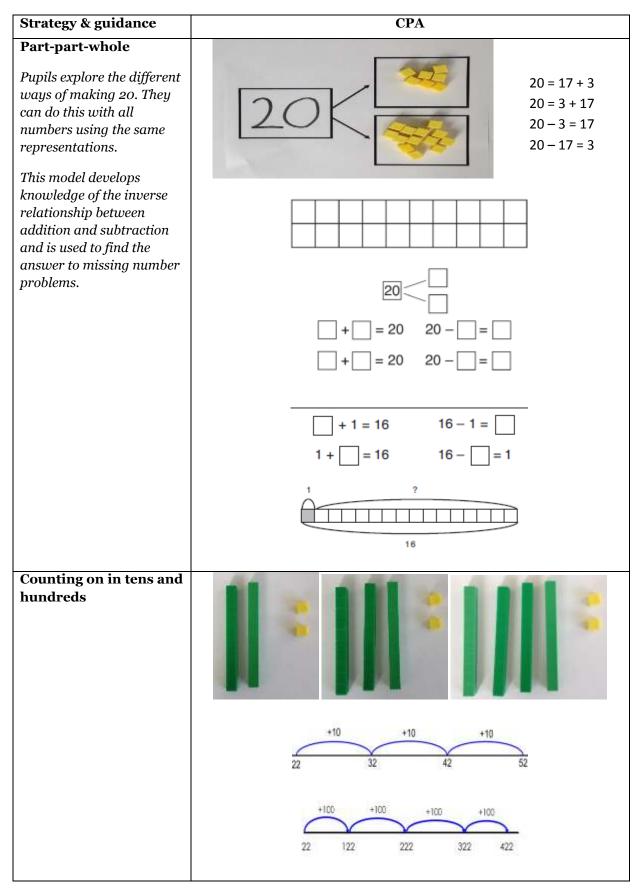

The following objectives should be planned for lessons where new strategies are being introduced and developed:

- Solve problems with addition and subtraction: using concrete objects and pictorial representations, including those involving numbers, quantities and measures; apply increasing knowledge of mental and written methods.
- Solve problems, including missing number problems, using number facts, place value and more complex addition and subtraction. (Year 3)

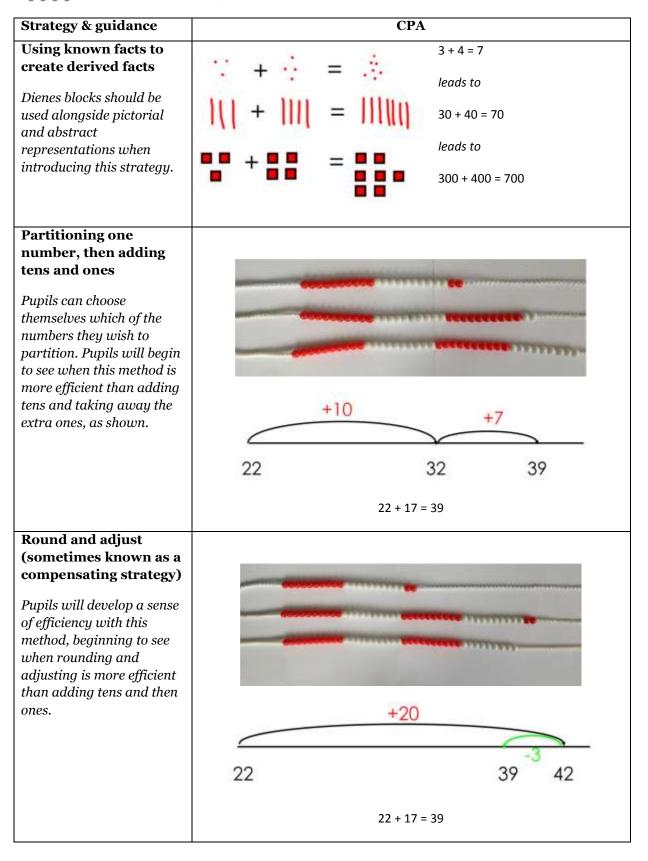

Teachers should refer to the definitions and guidance on the <u>structures for addition and</u> <u>subtraction</u> to provide a range of appropriate real-life contexts for calculations.

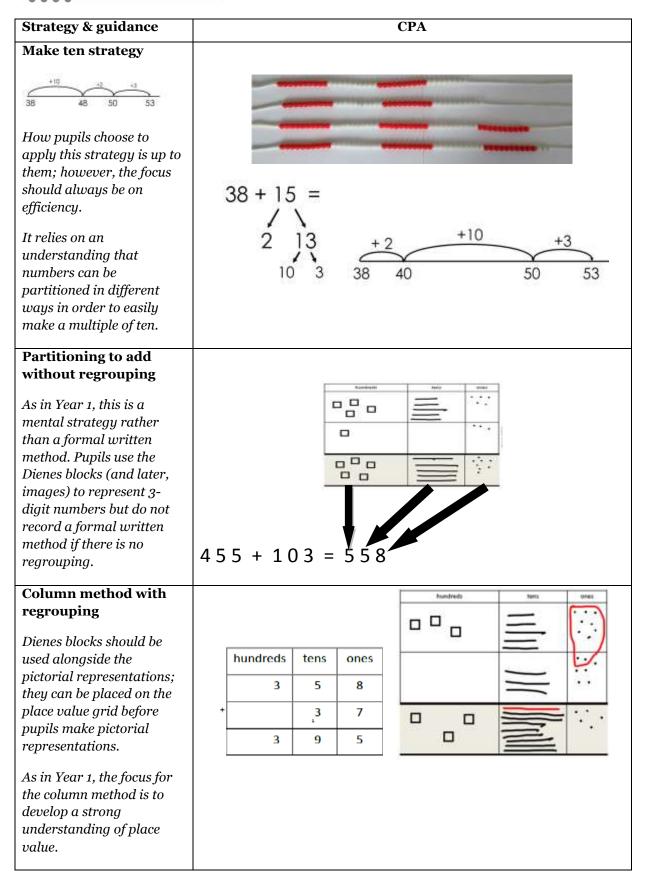

Y2 Addition

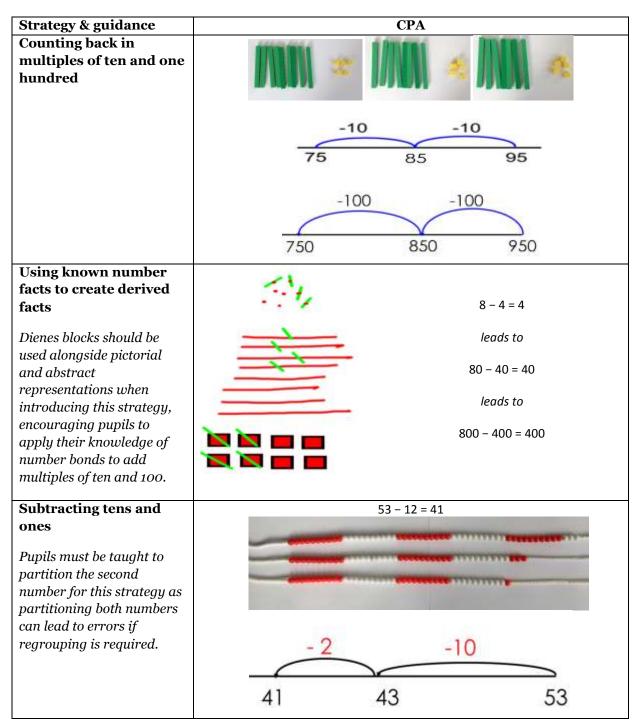

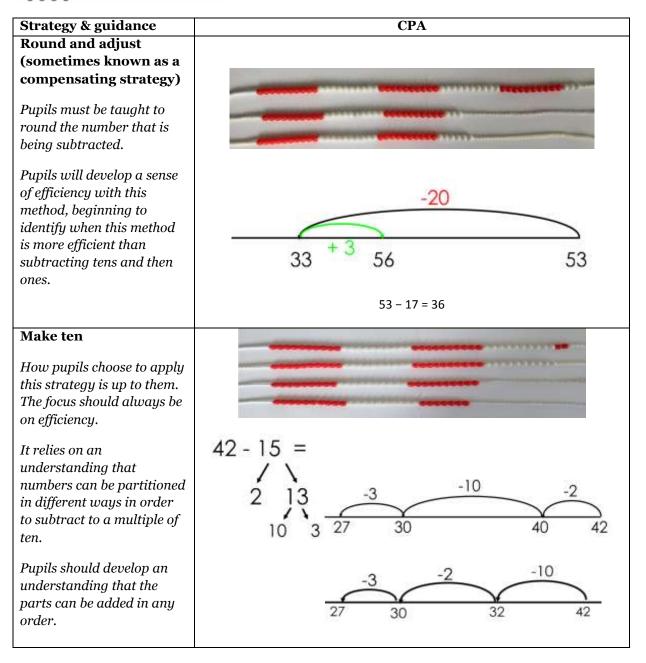

Copyright © 2017 Mathematics Mastery. This can be printed out and photocopied by Mathematics Mastery toolkit registered users only. For further information, please see our terms and conditions at <u>www.mathematicsmastery.org/terms-and-conditions</u>

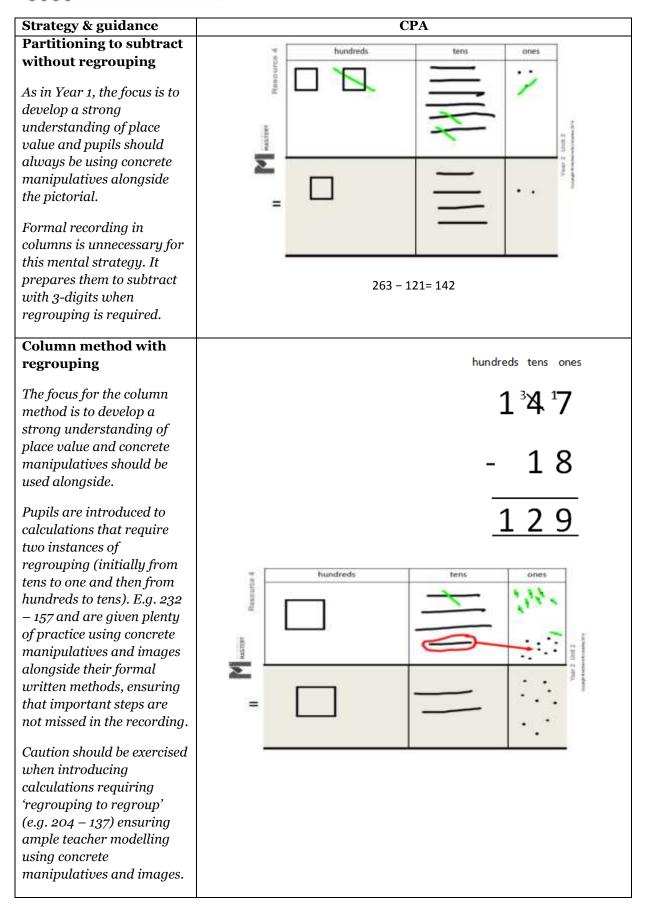

Y2 Subtraction

National Curriculum objectives linked to multiplication and division

These objectives are explicitly covered through the strategies outlined in this document:

- Recall and use multiplication and division facts for the 2, 5 and 10 multiplication tables, including recognising odd and even numbers.
- Recall and use multiplication and division facts for the 3 and 4 multiplication tables (Year 3).
- Show that multiplication of two numbers can be done in any order (commutative) but division of one number by another cannot.

The following objectives should be planned for lessons where new strategies are being introduced and developed:

- Calculate mathematical statements for multiplication and division within the multiplication tables and write them using the multiplication (×), division (÷) and equal (=) signs.
- Solve problems involving multiplication and division, using materials, arrays, repeated addition, mental methods and multiplication and division facts, including problems in context.

Teachers should refer to definitions and guidance on the <u>structures for multiplication</u> and <u>division</u> to provide a range of appropriate real-life contexts for calculations.

Strategy & guidance	СРА		
Arrays to represent multiplication equations Concrete manipulatives and images of familiar			
objects begin to be organised into arrays and, later, are shown alongside dot arrays. It is important to discuss with pupils how arrays can be useful. Pupils begin to			
understand multiplication in a more abstract fashion, applying their skip counting skills to identify the multiples of the 2x, 5x and 10x tables.	•••••		
The relationship between multiplication and division also begins to be demonstrated.			
Multiplication is commutative Pupils should understand that an array and, later, bar models can represent different equations and that, as multiplication is commutative, the order	3 x 5 = 5 x 3 =		
of the multiplication does not affect the answer.			
	12 = 3 × 4	12 = 4 × 3	

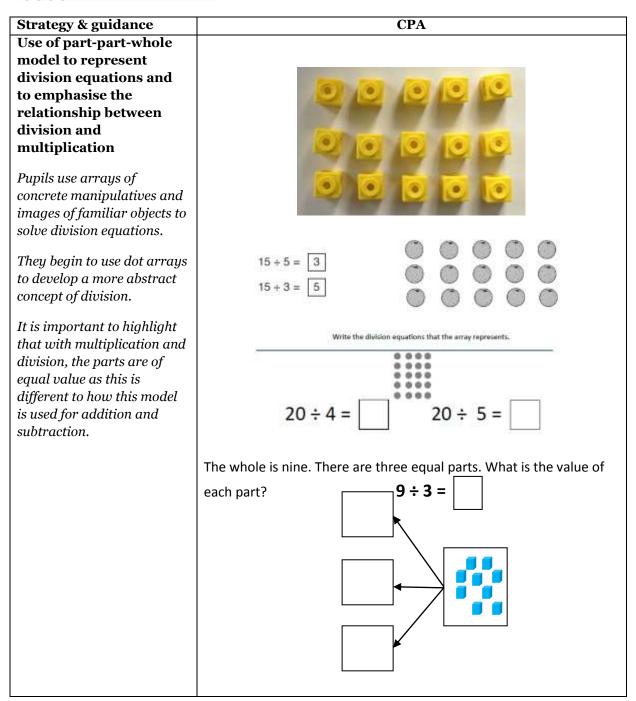

Y2 Division

Progression in calculations Year 3

National Curriculum objectives linked to addition and subtraction

These objectives are explicitly covered through the strategies outlined in this document:

- add and subtract numbers mentally, including:
 - o a three-digit number and ones
 - o a three-digit number and tens
 - a three-digit number and hundreds
- add and subtract numbers with up to four digits, using formal written methods of columnar addition and subtraction (four digits is Year 4)
- find 10 or 100 more or less than a given number
- find 1 000 more or less than a given number (Year 4)
- estimate the answer to a calculation and use inverse operations to check answers

The following objectives should be planned for lessons where new strategies are being introduced and developed:

• solve problems, including missing number problems, using number facts, place value, and more complex addition and subtraction

Teachers should refer to definitions and guidance on the <u>structures for addition</u> <u>and subtraction</u> to provide a range of appropriate real-life contexts for calculations.

Y3 Addition & Subtraction

Strategy & guidance	СРА		
Add and subtract numbers mentally,	It is important to model the mental strategy		
including:	using concrete manipulatives in the first		
• a three-digit number and ones;	instance and pupils should be able to		
• a three-ught humber and ones,	exemplify their own strategies using		
• a three-digit number and tens;	manipulatives if required, with numbers		
	appropriate to the unit they are working on		
• a three-digit number and hundreds	(3-digit numbers in Units 1 & 4; 4-digit		
Pupils learn that this is an appropriate strategy when	numbers in Unit 13). However, pupils		
they are able to use known and derived number facts	should be encouraged to use known facts to		
or other mental strategies to complete mental	derive answers, rather than relying on		
calculations with accuracy.	counting manipulatives or images.		
To begin with, some pupils will prefer to use this			
strategy only when there is no need to regroup, using	No regrouping		
number facts within 10 and derivations. More			
confident pupils might choose from a range of mental	345 + 30 274 - 50		
strategies that avoid written algorithms, including (but not exhaustively):	1128 + 300 1312 - 300		
(out not exhlusticely).			
• known number facts within 20,	326 + 342 856 - 724

Strategy & guidance	СРА
Find 10, 100 more or less than a given number	142 + 100 = 242
As pupils become familiar with numbers up to 1000, place value should be emphasised and comparisons drawn between adding tens, hundreds (and, in the last unit of the Summer term, thousands), including use of concrete manipulatives and appropriate images.	
After initial teaching, this should be incorporated into transition activities and practised regularly.	

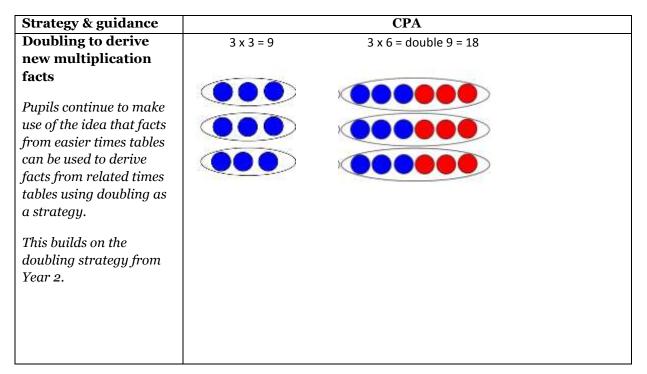

National Curriculum objectives linked to multiplication and division

These objectives are explicitly covered through the strategies outlined in this document:

- count from 0 in multiples of 4, 8, 50 and 100
- recall and use multiplication and division facts for the 3, 4, 6, and 8 multiplication tables
- write and calculate mathematical statements for multiplication and division using the multiplication tables that they know, including for two-digit numbers times one-digit numbers, using mental methods
- solve problems, including missing number problems, involving multiplication and division, including positive integer scaling problems and correspondence problems in which *n* objects are connected to *m* objects

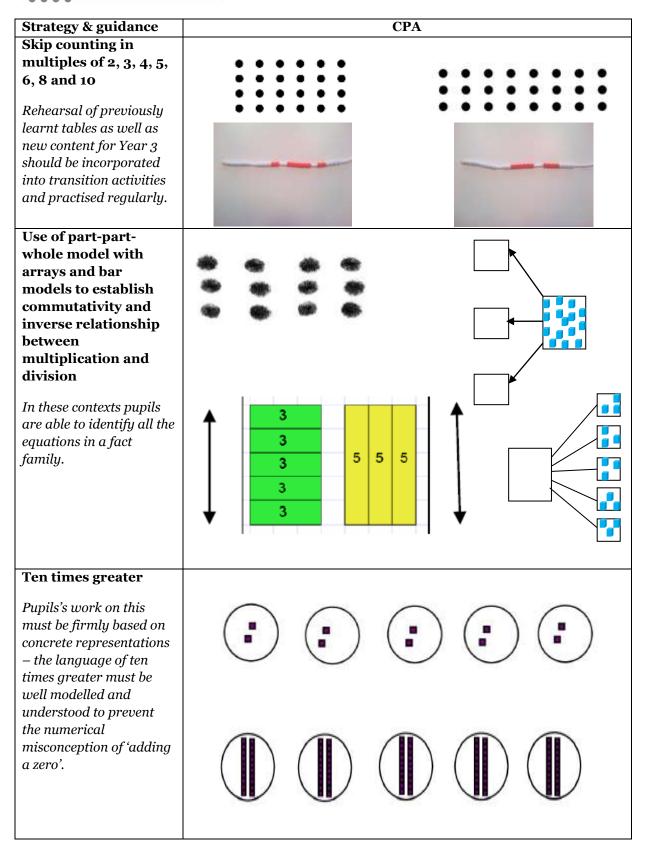

Teachers should refer to definitions and guidance on the <u>structures for multiplication</u> and <u>division</u> to provide a range of appropriate real-life contexts for calculations.

Strategy & guidance	СРА
Multiplying by 10 and	
100 Building on the ten times	5 × 1 = 5 (1) (1) (1) (1)
greater work, pupils use appropriate Dienes blocks and place value counters to multiply 2, 3,	5 × 10 = 50 10 10 10 10 10
4, 5 and 10 by 10, 100 and 1000.	3 × 1 = 3
	3 × 100 = 300
Using known facts for multiplying by multiples of 10 and	5 = 1 × 5 • • • • •
100	50 = 10 × 5
Pupils' growing understanding of place value, allows them to make use of known facts to derive multiplications	500 = 100 × 5
using powers of 10.	3 × 2 = 6 30 × 2 = 60 300 × 2 = 600
It is important to use tables with which they are already familiar (i.e. not 7 or 9 tables in Year	
3)	: = X

Strategy & guidance Multiplication of 2digit numbers with partitioning (no regrouping)

Children should always consider whether partitioning is the best strategy – if it is possible to use strategies such as doubling (some may use doubling twice for ×4), they need to choose the most efficient strategy.

Children may wish to make jottings, including a full grid as exemplified *here – but grid method is* not a formal method and its only purpose is to record mental calculations. This supports the development of the necessary mental calculating skills but does not hinder the introduction of formal written methods in Year 4. Concrete manipulatives are essential to develop understanding.

Strategy & guidance CPA Multiplication of 2digit numbers with 4 × 10 4 10 × partitioning (regrouping) -3 30 12 3 Using concrete 30 12 14 × 3 = 42 manipulatives and later *moving to using images* that represent them, supports pupils' early 40 5 × understanding, leading towards formal written methods in Year 4. 3 Once again, this is a mental strategy, which they may choose to support with informal *jottings, including a full* grid, as exemplified here. Pupils must be encouraged to make use of their known multiplication facts and their knowledge of place value to calculate, rather than counting manipulatives.

<u>Y3 Division</u>

Strategy & Guidance	(CPA
Dividing multiples of		
10, 100 and 1000 by	hundreds tens	ones
10, 100 and 1000		
using scaling down		
Pupils use the strategy of 'scaling down', representing numbers		3 3 × 10 = 30
with concrete manipulatives and making the value ten times smaller.	3	0
		30 ÷ 10 = 3
Dividing multiples of 10, 100 and 1000 by 10, 100 and 1000 using grouping Pupils divide by 10, 100 and 1000 by making groups of the divisor.	500 ÷ 100 = My whole is 500 and the value of t equal parts is 100. How many parts there?	(100) (100)

Progression in calculations Year 4

National curriculum objectives linked to addition and subtraction

These objectives are explicitly covered through the strategies outlined in this document:

- add and subtract numbers with up to four digits, using the formal written methods of columnar addition and subtraction where appropriate
- find 1 000 more or less than a given number
- estimate and use inverse operations to check answers to a calculation

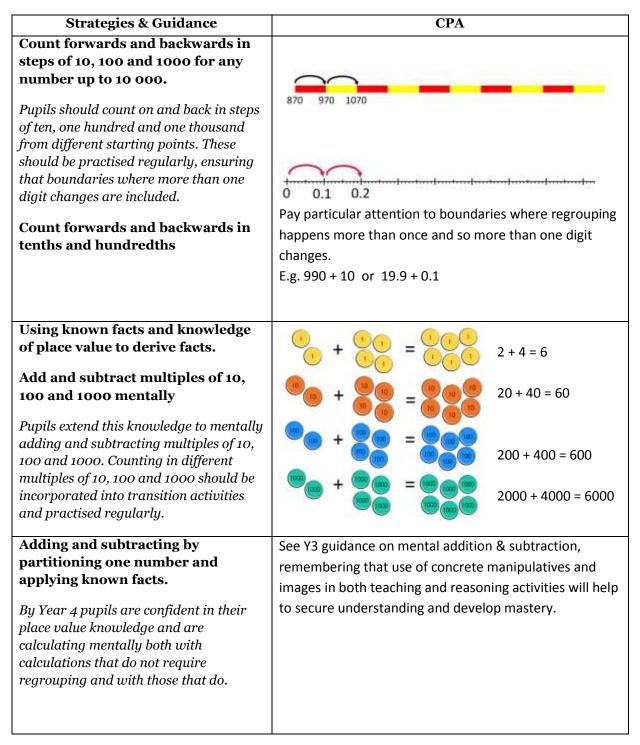

N.B. There is no explicit reference to mental calculation strategies in the programmes of study for Year 4 in the national curriculum. However, with an overall aim for fluency, appropriate mental strategies should always be considered before resorting to formal written procedures, with the emphasis on pupils making their own choices from an increasingly sophisticated range of strategies.

The following objectives should be planned for lessons where new strategies are being introduced and developed:

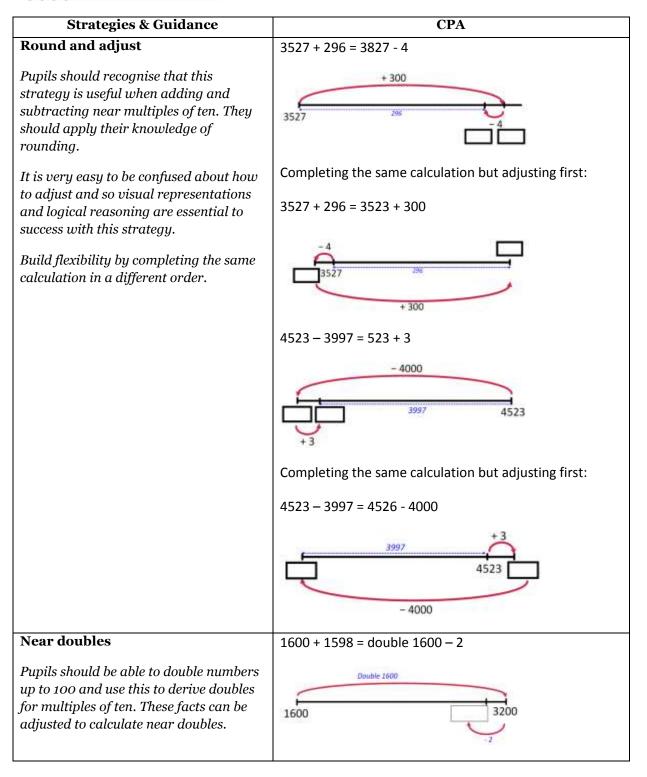

- solve addition and subtraction two-step problems in contexts, deciding which operations and methods to use and why
- solve simple measure and money problems involving fractions and decimals to two decimal places

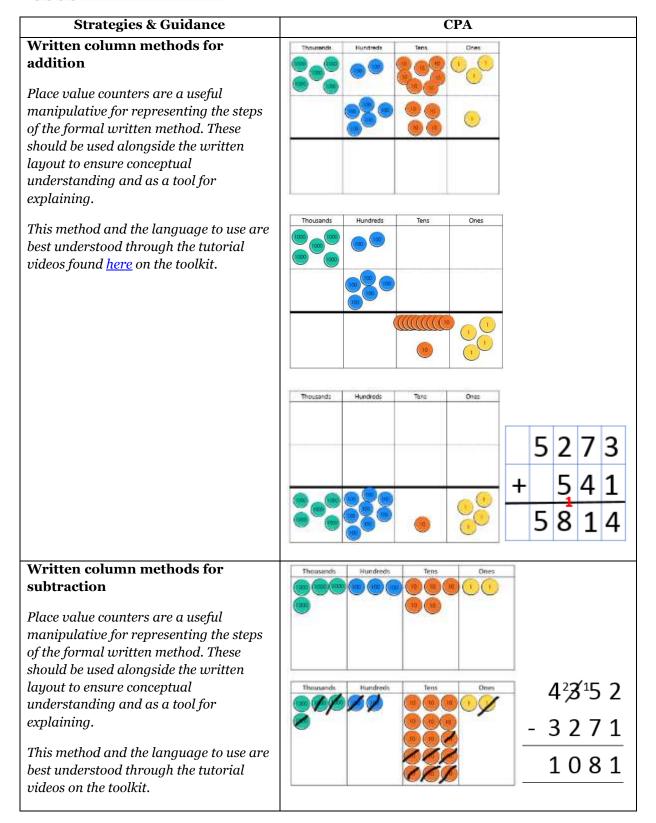

Y4 Addition & Subtraction

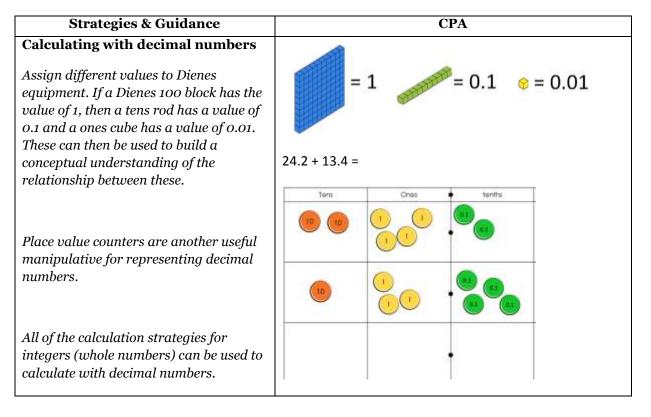

National Curriculum objectives linked to multiplication and division

These objectives are explicitly covered through the strategies outlined in this document:

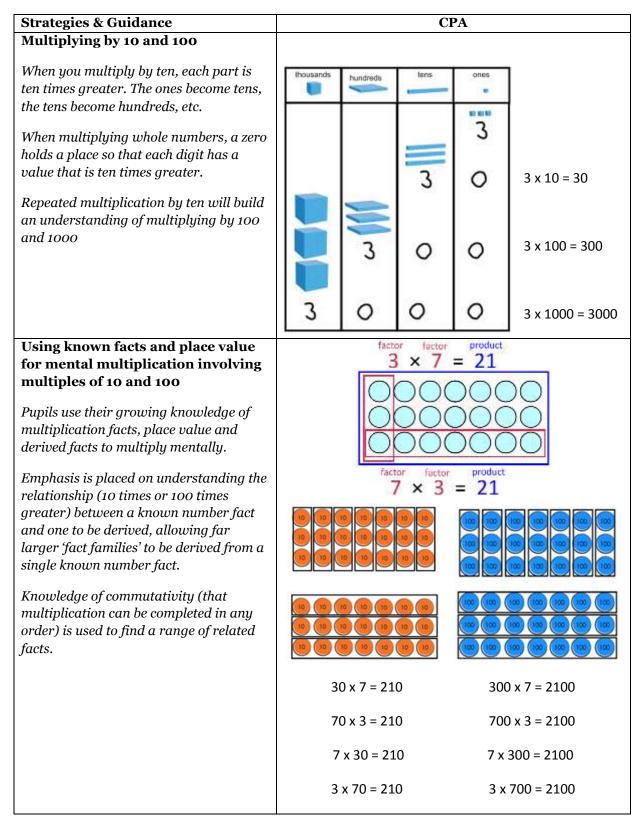

- count from 0 in multiples of 6, 7, 9, 25 and 1000
- recall and use multiplication and division facts for multiplication tables up to 12×12
- write and calculate mathematical statements for multiplication and division using the multiplication tables that they know, including for two-digit numbers times one-digit numbers, using mental and progressing to formal written methods
- recognise and use factor pairs and commutativity in mental calculations
- use place value, known and derived facts to multiply and divide mentally, including: multiplying by 0 and 1; dividing by 1; multiplying together three numbers
- multiply two-digit and three-digit numbers by a one-digit number using formal written layout
- find the effect of dividing a one- or two-digit number by 10 and 100, identifying the value of the digits in the answer as ones, tenths and hundredths.

The following objectives should be planned for lessons where new strategies are being introduced and developed:

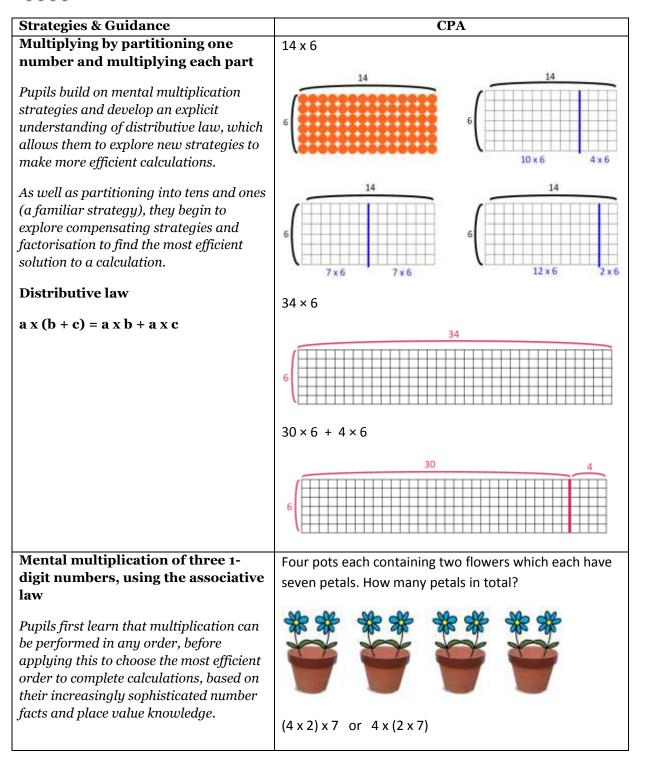

• solve problems involving multiplying and adding, including using the distributive law to multiply two digit numbers by one digit, integer scaling problems and harder correspondence problems such as *n* objects are connected to *m* objects.

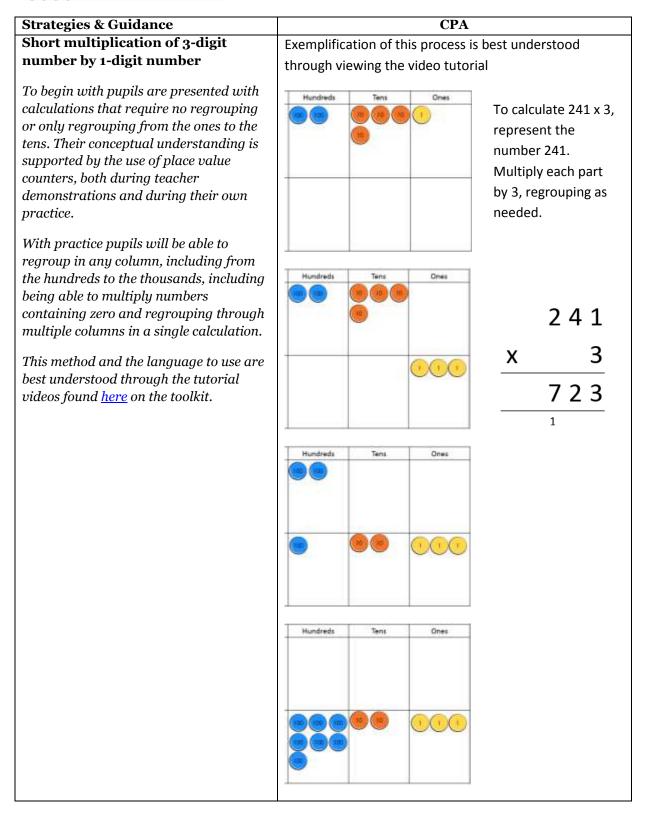

Y4 Multiplication

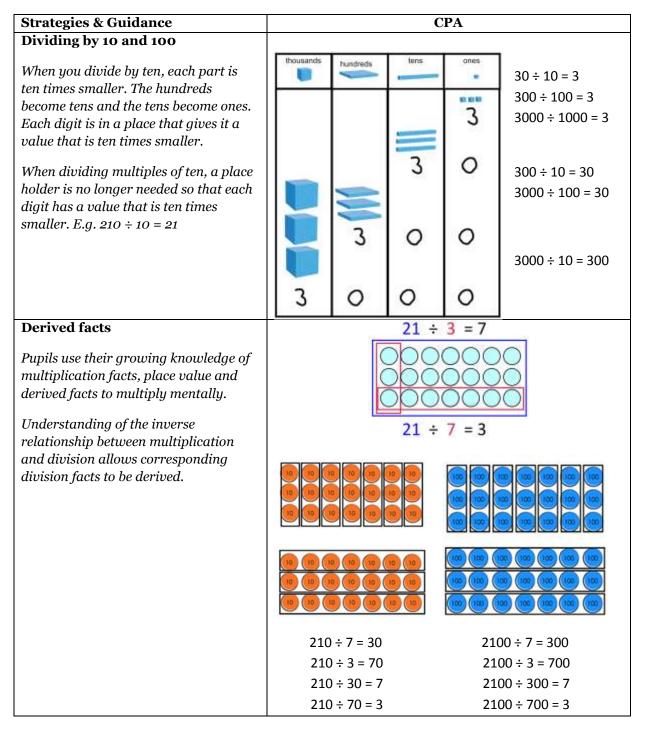

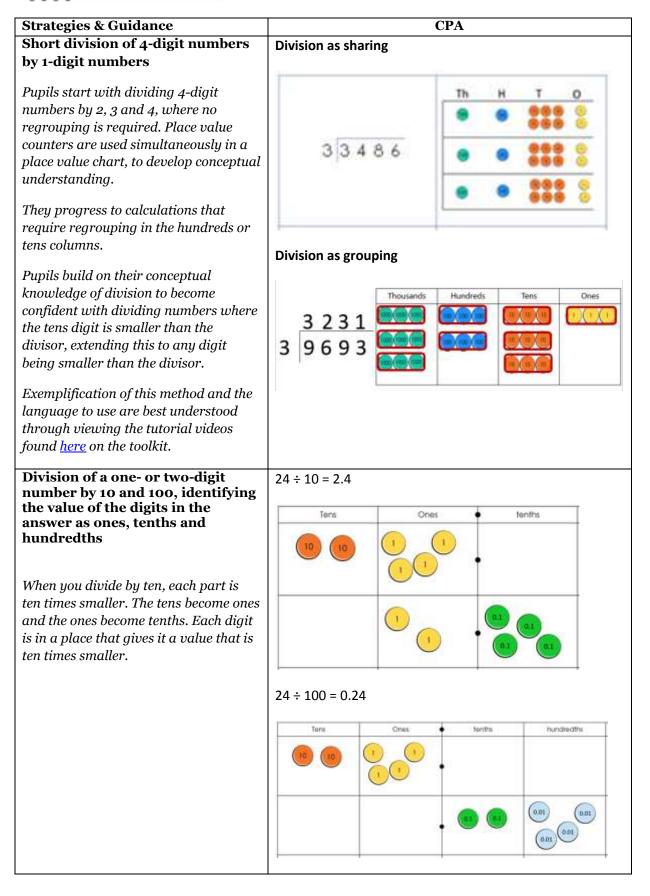

Y4 Division

Progression in calculations Year 5 + Year 6

Year 5 and Year 6 are together because the calculation strategies used are broadly similar, with Year 6 using larger and smaller numbers. Any differences for Year 6 are highlighted in red.

National Curriculum objectives linked to integer addition and subtraction

These objectives are explicitly covered through the strategies outlined in this document:

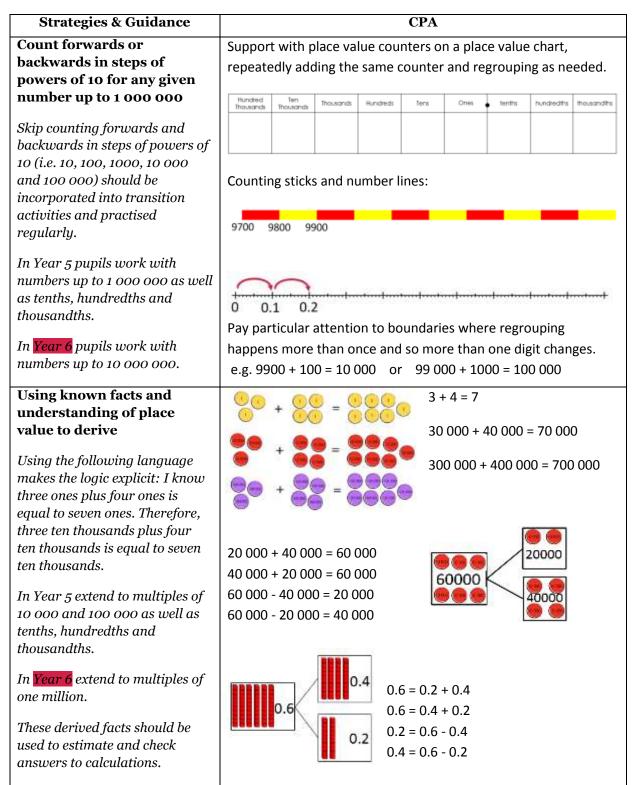

- add and subtract numbers mentally with increasingly large numbers
- add and subtract whole numbers with more than 4 digits, including using formal written methods (columnar addition and subtraction)
- use negative numbers in context, and calculate intervals across zero
- perform mental calculations, including with mixed operations and large numbers
- use estimation to check answers to calculations and determine, in the context of a problem, an appropriate degree of accuracy

The following objectives should be planned for lessons where new strategies are being introduced and developed:

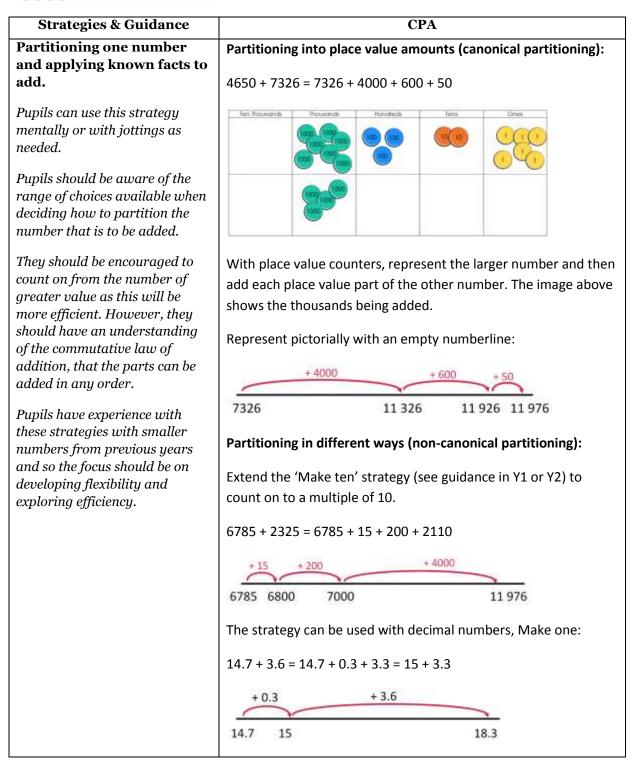

- use rounding to check answers to calculations and determine, in the context of a problem, levels of accuracy
- solve addition and subtraction multi-step problems in contexts, deciding which operations and methods to use and why
- solve problems involving addition, subtraction, multiplication and division and a combination of these, including understanding the meaning of the equals sign.

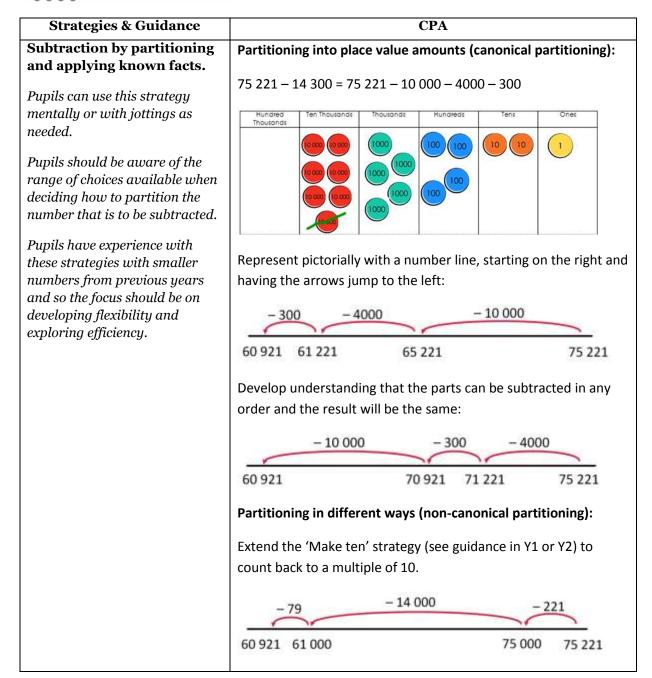

Y5 and Y6 Addition & Subtraction

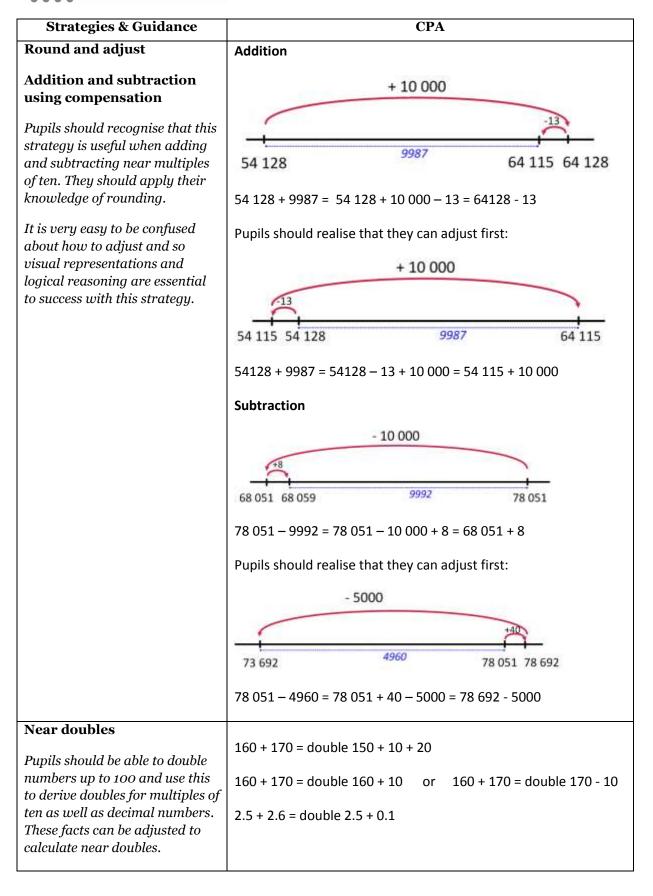

Strategies & Guidance	СРА
Calculate difference by	75 221 – 14 300
"counting back" It is interesting to note that finding the difference is reversible. For example, the difference between 5 and 2 is the same as the difference between 2 and 5. This is not the case for other subtraction concepts.	Place the numbers either end of a numberline and work out the difference between them. Select efficient jumps.
	- 700 - 60 000 - 221 14 300 15 000 75 000 75 221
	Finding the difference is efficient when the numbers are close to each other:
	9012 – 8976
	- 24 - 12 8976 9000 9012
Calculate difference by "counting on"	75 221 – 14 300
Addition strategies can be used to find difference.	+ 700 + 60 000 + 221 14 300 15 000 75 221
	Finding the difference is efficient when the numbers are close to each other
	9012 – 8976
	+ 24 + 12 8976 9000 9012

Written column methods for subtraction	4 1 3 6 2
In Year 5, pupils are expected to be able to use formal written methods to subtract whole	
methods to subtract whole numbers with more than four digits as well as working with numbers with up to three decimal places.	
Pupils should be given plenty of practice with calculations that require multiple separate instances of regrouping.	- 3 2 2 4 3 9 1 1 9
In Year 3 and 4 they become more familiar with calculations that require 'regrouping to regroup'. Understanding must be secured through the considered use of manipulatives and images, combined with careful use of language. Pupils should think about if this is the most efficient method, considering whether mental strategies (such as counting on, using known number facts, compensation etc.) may be likelier to produce an accurate solution.	 The term regrouping should be the language used. You can use the terms 'exchange' with subtraction but it needs careful consideration. You can regroup 62 as 50 and 12 (5 tens and 12 ones) instead of 60 and 2 (6 tens and 12 ones). Or you can 'exchange' one of the tens for 10 ones resulting in 5 tens and 12 ones. If you have exchanged, then the number has been regrouped.
Exemplification of this method and the language to use are best understood through viewing the tutorial videos found <u>here</u> on the toolkit.	

Progression in calculations

Year 5 +Year 6

National Curriculum objectives linked to multiplication and division

These objectives are explicitly covered through the strategies outlined in this document:

- multiply and divide whole numbers by 10, 100 and 1000
- multiply numbers up to 4 digits by a one- or two-digit number using a formal written method, including long multiplication for two-digit numbers
- multiply and divide numbers mentally drawing upon known facts
- divide numbers up to 4 digits by a one-digit number using the formal written method of short division and interpret remainders appropriately for the context
- multiply multi-digit numbers up to 4 digits by a two-digit whole number using the formal written method of long multiplication
- divide numbers up to 4 digits by a two-digit whole number using the formal written method of long division, and interpret remainders as whole number remainders, fractions, or by rounding, as appropriate for the context
- divide numbers up to 4 digits by a two-digit number using the formal written method of short division where appropriate, interpreting remainders according to the context
- multiply one-digit numbers with up to two decimal places by whole numbers
- use written division methods in cases where the answer has up to two decimal places

The following objectives should be planned for lessons where new strategies are being introduced and developed:

- solve problems involving multiplication and division including using their knowledge of factors and multiples, squares and cubes
- solve problems involving addition, subtraction, multiplication and division and a combination of these, including understanding the meaning of the equals sign
- use their knowledge of the order of operations to carry out calculations involving the four operations
- solve addition and subtraction multi-step problems in contexts, deciding which operations and methods to use and why
- solve problems involving addition, subtraction, multiplication and division
- solve problems involving the relative sizes of two quantities where missing values can be found by using integer multiplication and division facts.

Strategies & Guidance	СРА			
Multiply and divide whole numbers and those involving decimals by 10, 100 and 1000	When you multiply by ten, each part is ten times greater. The ones become tens, the tens become hundreds, etc. When multiplying whole numbers, a zero holds a place so that each			
Avoid saying that you "add a zero" when multiplying by ten and instead use the language of place holder. Use place value counters and charts to visualise and then notice what happens	digit has a value that is ten times greater. 102.14 x 10 = 1021.4 Thousands Hundreds Tens Ones tenths hundredths 100 (100 1 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0			
then notice what happens to the digits.	Image: Construction of the second s

Y5 and Y6 Division

Strategies & Guidance	СРА				
Using knowledge of factors to divide			24	ŀ	I know 2 and 12 are a
Pupils explore this strategy when using repeated halving.	?		14	4	factor pair of 24 and so I can divide by 2
2 x 2 = 4 and so if you divide by 4 the same result can be achieved by dividing by two and then by		144 ÷ 24		and then by 12.	
two again.		12	_	12	_
	?	72	14	4	
		14	4 ÷ 2	÷12	

Strategies & Guidance	СРА			
Short division	8528÷4 7177			
Dividing a 4-digit numbers by 1-digit numbers	2132			
The thought process of the traditional algorithm is as follows:	Sharing 4 8 5 ¹ 2 8 Thousands Hundreds Tens Ones			
How many 4s in 8? 2 How many 4s in 5? 1 with 1 remaining so regroup. How many 4s in 12? 3 How many 4s in 8? 2				
Warning: If you simply apply place value knowledge to each step, the thinking goes wrong if you have to regroup.	8 thousands shared into 4 equal groups			
How many 4s in 8000? 2000 How many 4s in 500? 100 with 1 remaining (illogical) The answer would be 125.	5 hundreds shared into 4 equal groups Regroup 1 hundred for 10 tens 12 tens shared into 4 equal groups 8 ones shared into 4 equal groups.			
Sharing the dividend builds conceptual understanding however doesn't scaffold the "thinking" of the algorithm. Using place value counters and finding groups of the divisor for each power of ten will build conceptual understanding of the short division algorithm.	Grouping Thousands Hundreds Tens Ones			
Area models are also useful representations, as seen with other strategies and exemplified for long division. Exemplification of this method and the language to use are best understood through viewing the tutorial videos found <u>here</u> on the toolkit.	How many groups of 4 thousands in 8 thousands? How many groups of 4 hundreds in 5 hundreds? Regroup 1 hundred for 10 tens. How many groups of 4 tens in 12 tens? How many groups of 4 ones in 8 ones?
